

# Porting VPCA to Google Earth Engine: Harmful algal blooms and Benthic cover

Dr. Joseph Ortiz ([jortiz@kent.edu](mailto:jortiz@kent.edu))

Kent State University  
Department of Geology

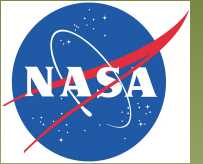

Today's talk

1. Lake Erie
2. Indian River Lagoon
3. Examples in GEE
  1. Landsat 8 HABS
  2. Sentinel 2 HABS
  3. Sentinel 2 Benthic cover

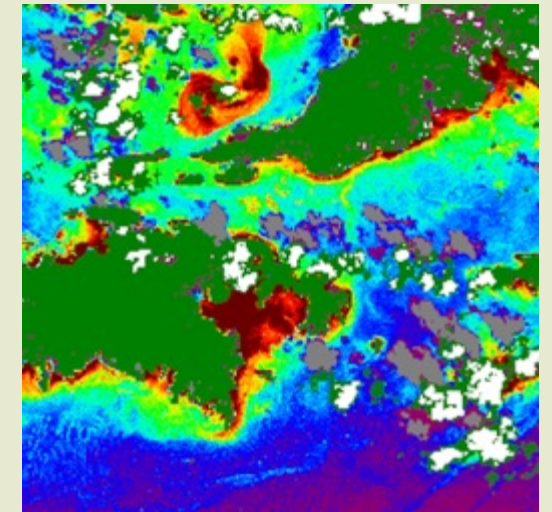

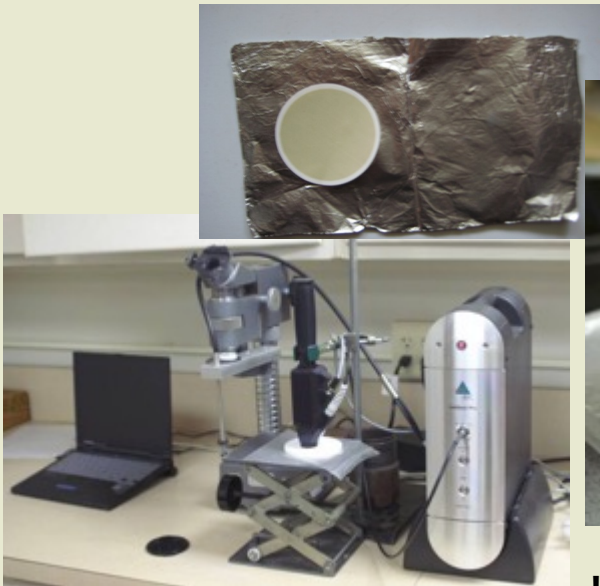

*KSU VPCA spectral decomposition from Sentinel 3A OLCI  
Lake Erie August 30, 2019*

# The Kent State Approach

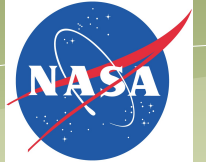

- ❑ Goal: Quantify the relationship between phytoplankton pigments and phytoplankton assemblages from Field Samples, Field Spectroradiometers, Remote Sensing data
- ❑ Objectives –
  - ❑ Measure water samples by visible derivative spectroscopy
  - ❑ Match spectral pigment assemblages to known signatures for classes of phytoplankton
  - ❑ Compare pigment assemblages to measures of concentration in the lake (Cell counts, pigments, degradation products, genomics).

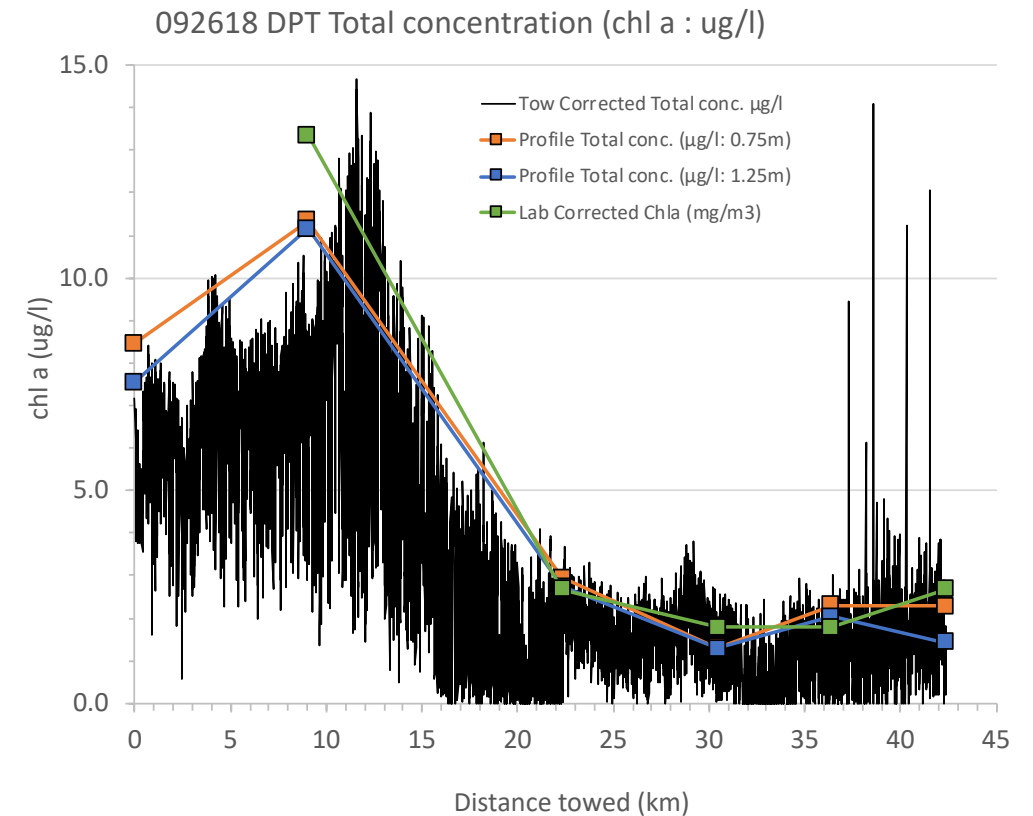

J. Ortiz, (2019 NOAA Coast Watch meeting ; jortiz@kent.edu)

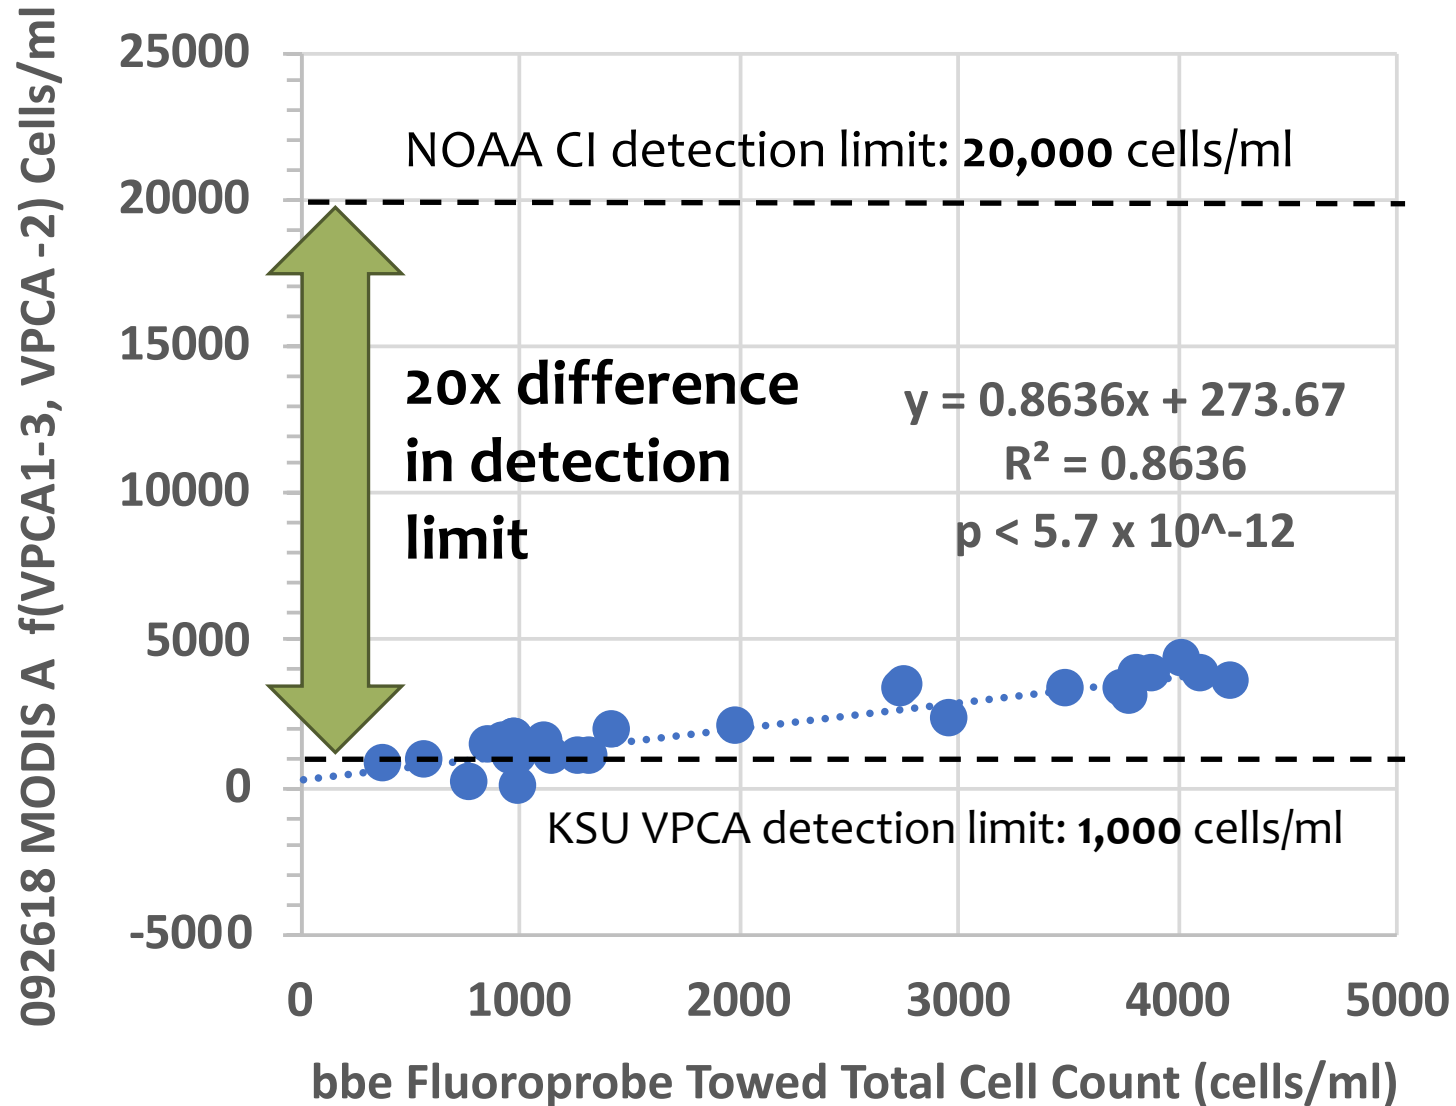

# Lake Erie 9/26/18, Detroit Plume Transect Sampling

\* Approx. sample locations

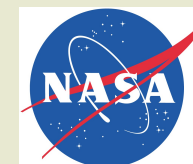

Non-HAB Algae      HAB cyanobacteria      Cryptophytes

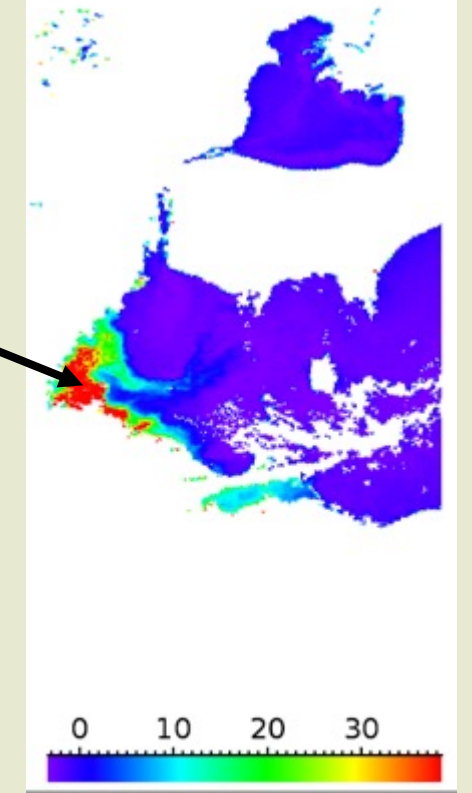

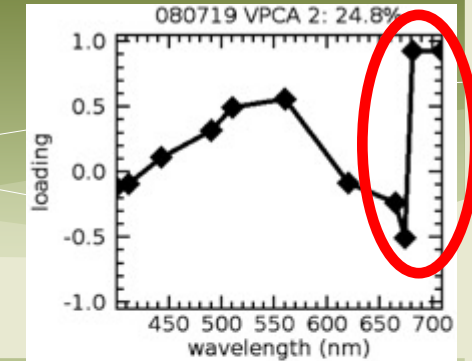

Standardized units

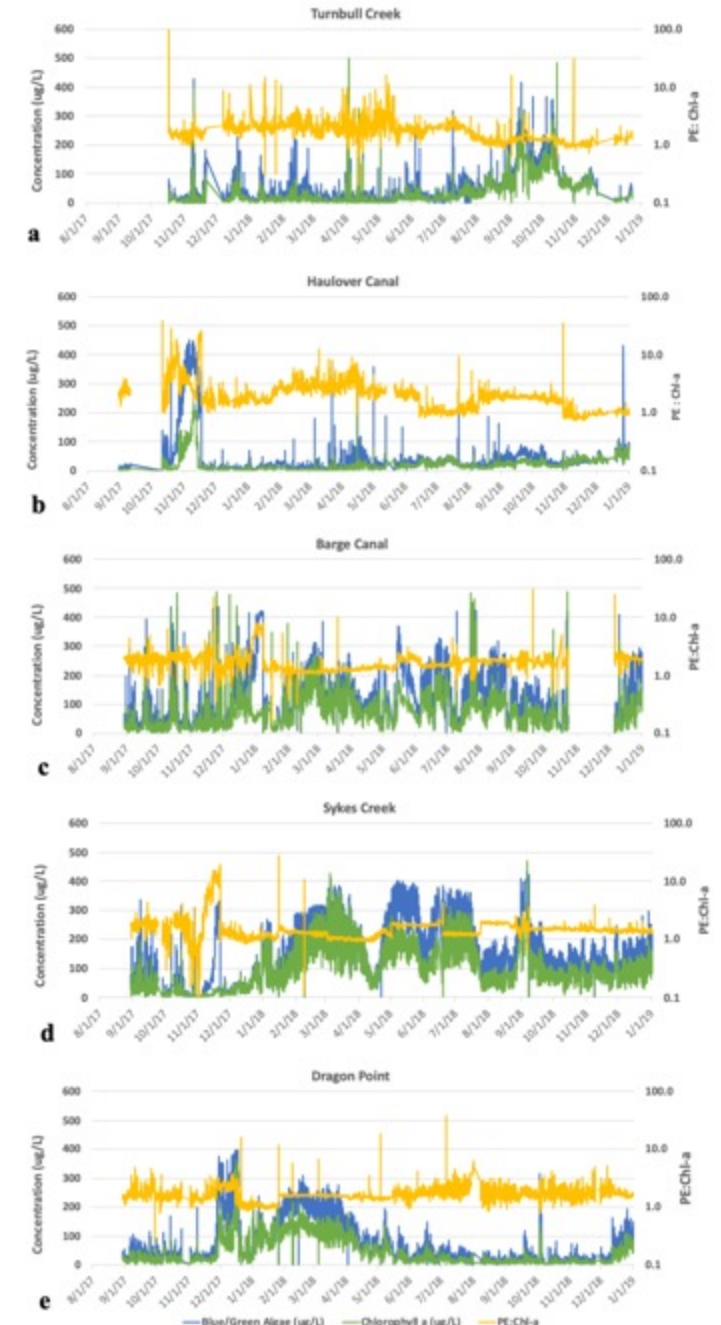

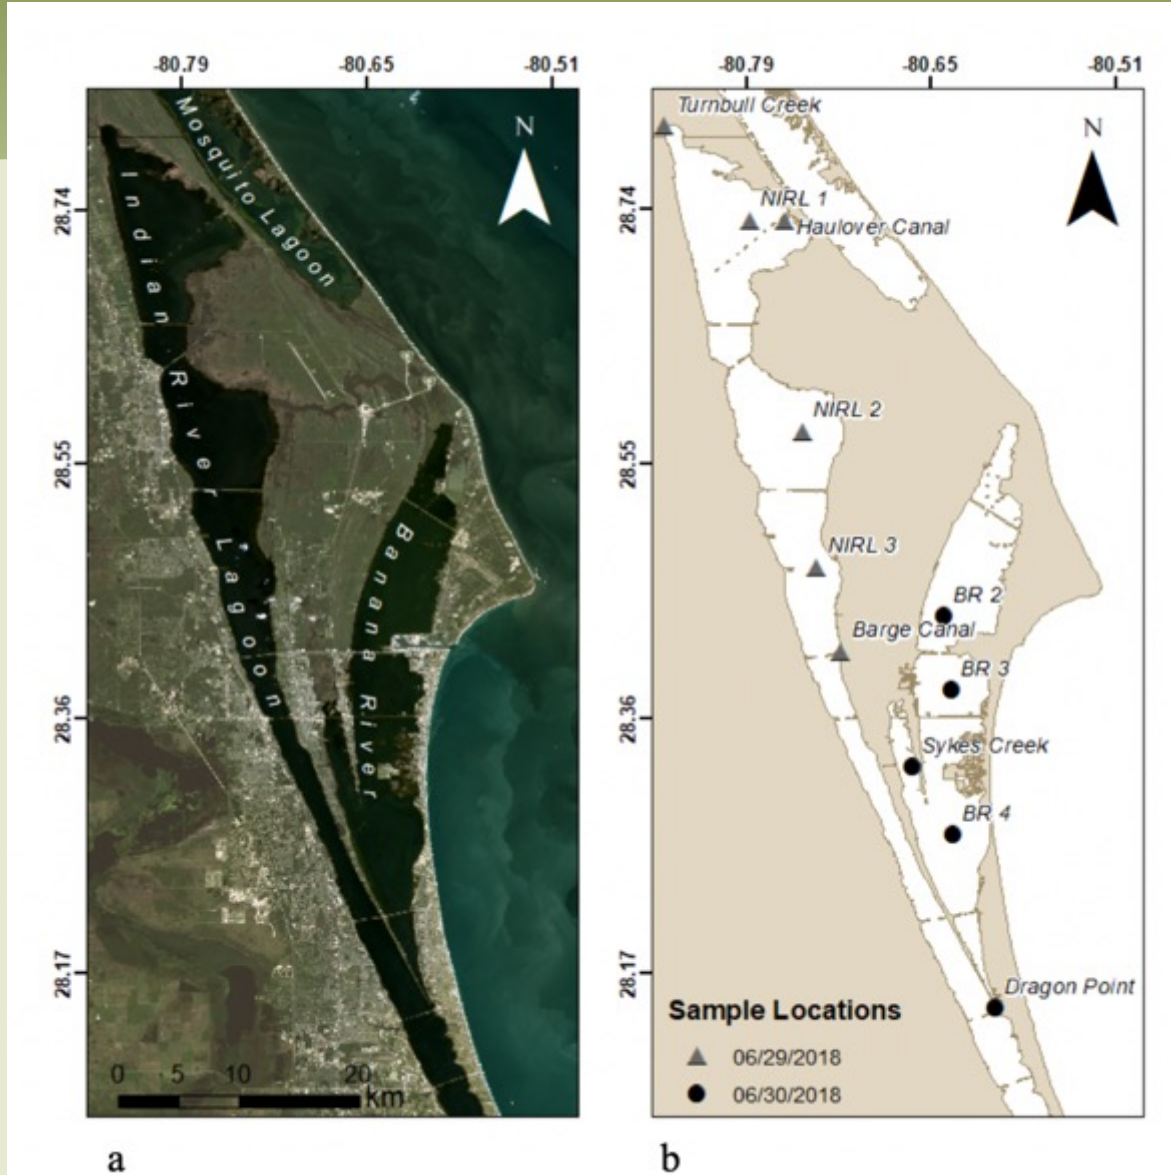

2019 HABGrab19 Sentinel 3 OCLI-derived NOAA CI (above) compared to leading two KSU VPCA components (left and right) The NOAA CI represents a mixture of these two components - and potentially two additional components (not shown) for NOAA Threshold of 20K cells/ml.

J. Ortiz, (2019 NASA Glenn HAB Algorithm meeting ; jortiz@kent.edu)

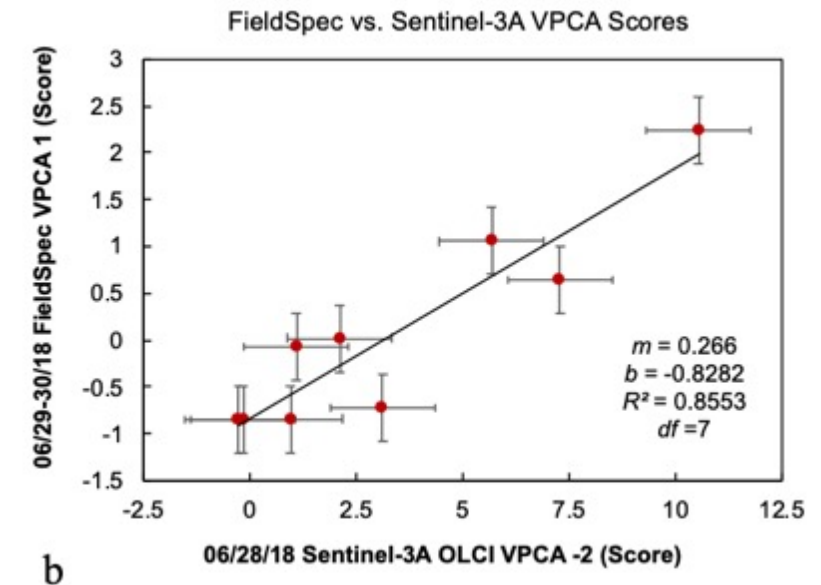

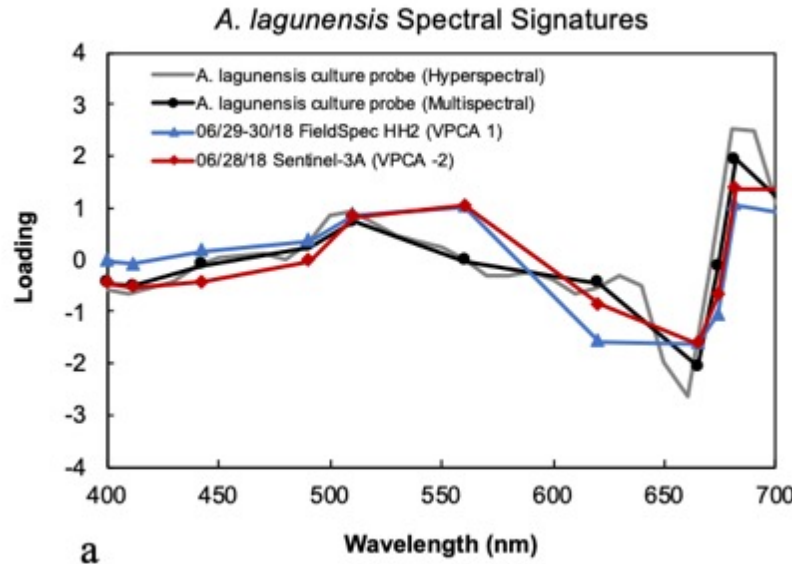

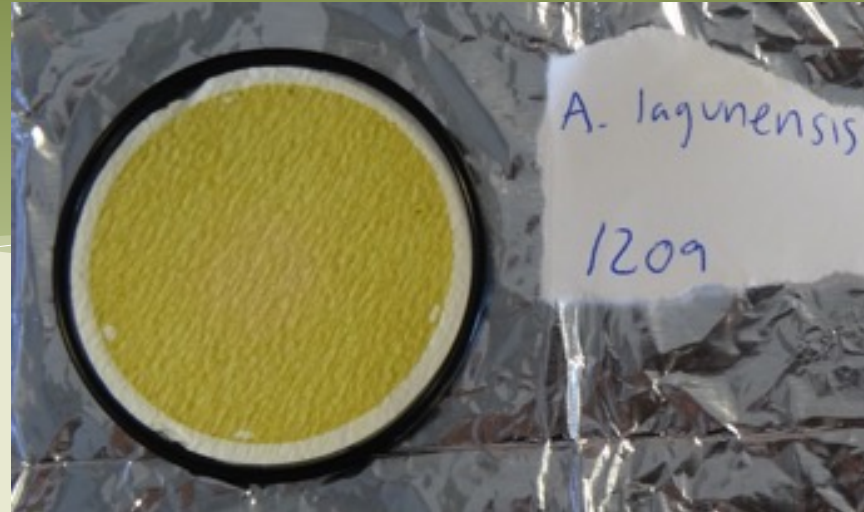

# Application to IRL with ORCA

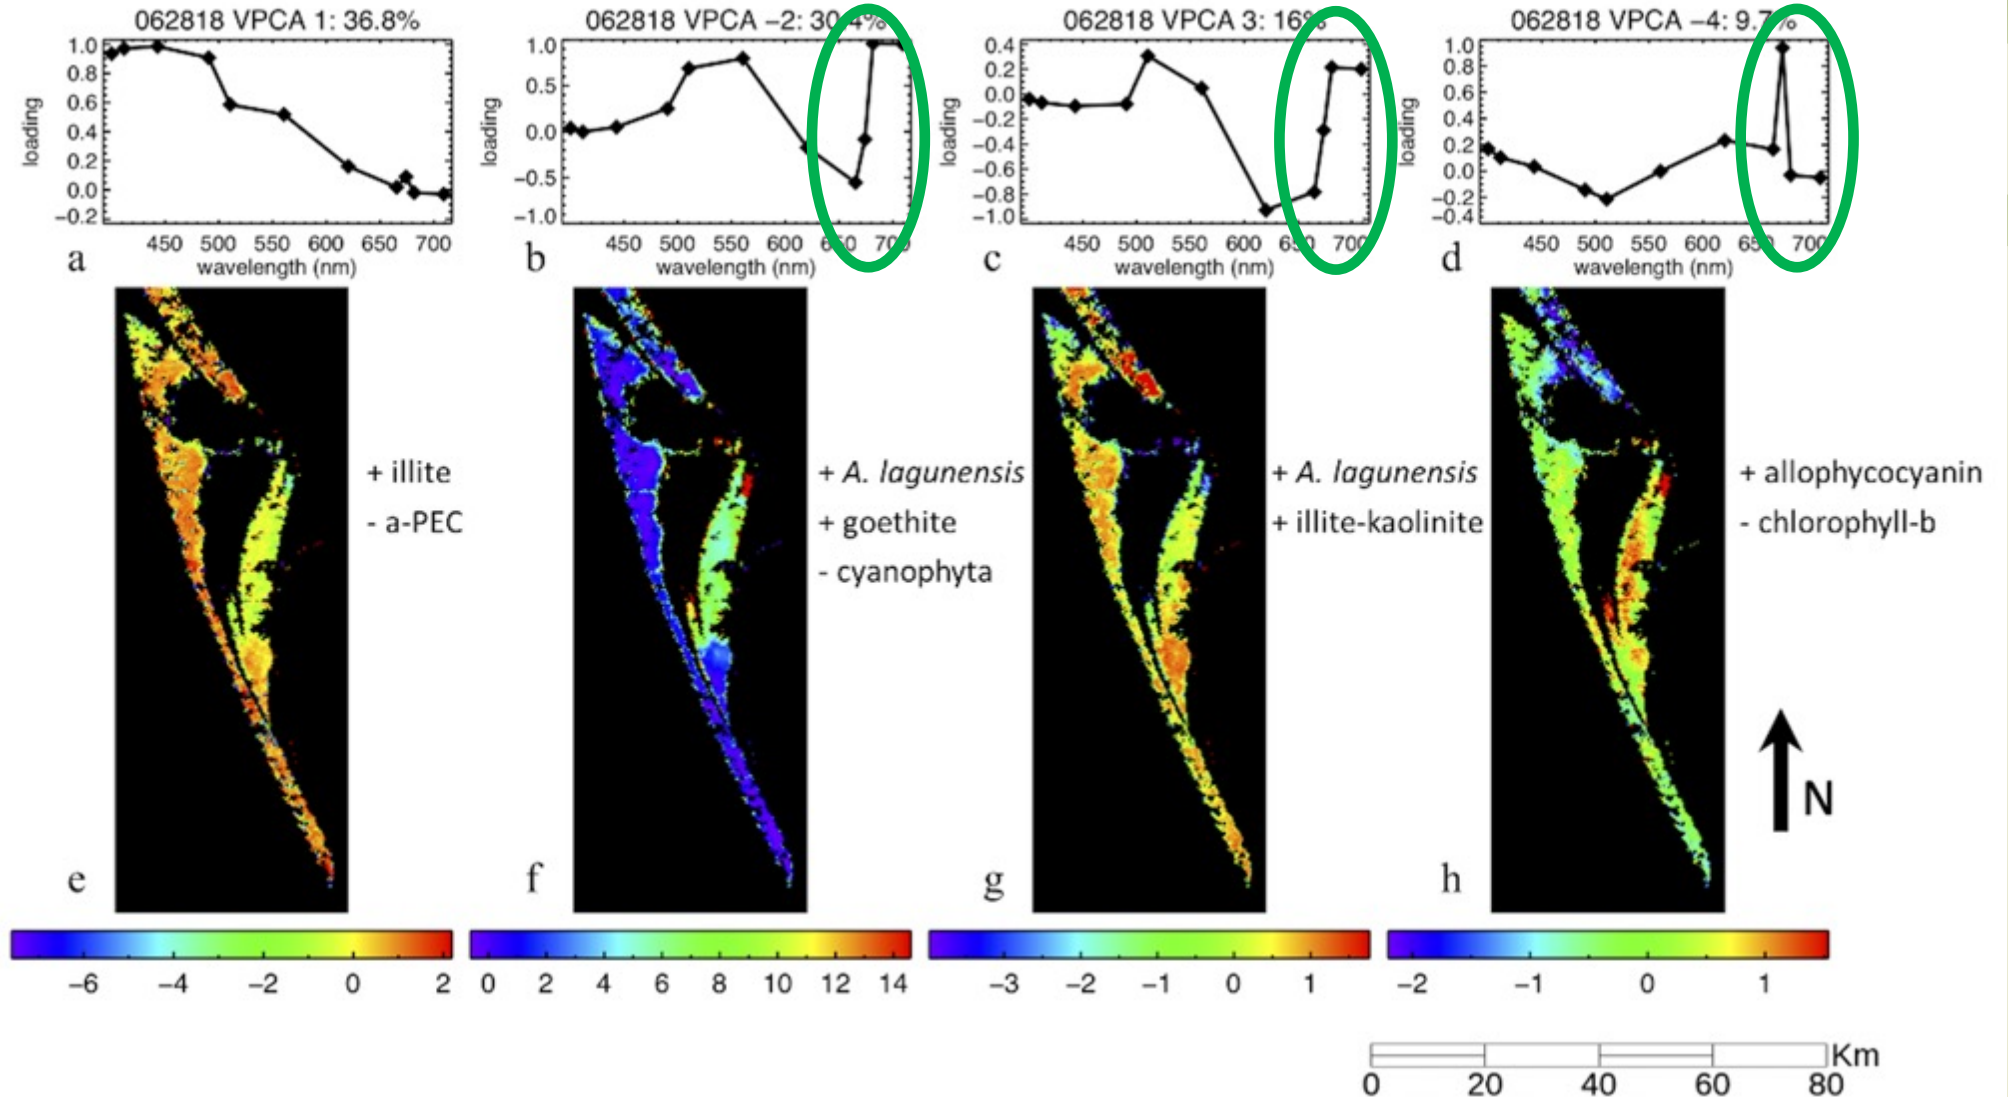

After Judice et al., GeoHealth, 2020

# A. Lagunensis culture ID

- Spectral fingerprint from an *A. lagunensis* culture matches **field** and **satellite** spectra
- Relative abundance from field and satellite station data match

- KSU method splits the image variance
- Select subset of components with a pigment related Red-edge response

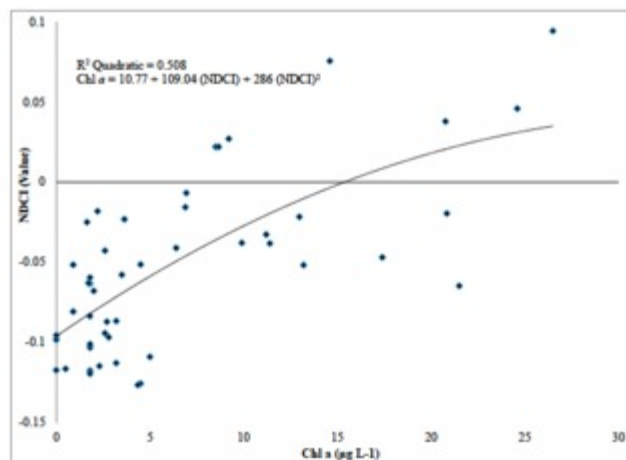

# Comparison with other Remote Sensing methods

VPCA explains twice as much variance with one third the noise

## Published NCDI Calibration

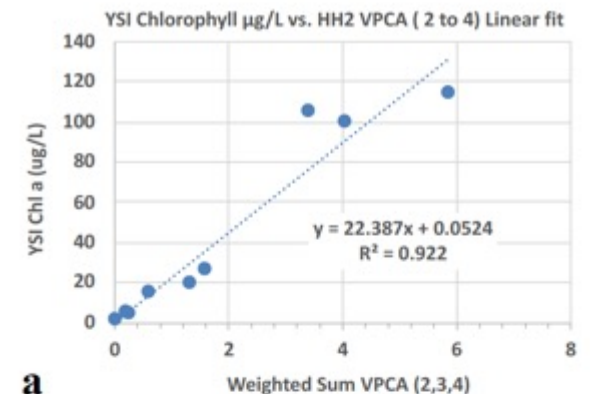

**Figure 4.** Regression analysis of *in-situ* Chl *a* measurements and their corresponding MERIS pixel data that has been converted by the NDCI algorithm. The resulting line of best fit is used to convert the NDCI values into estimated Chl *a*.

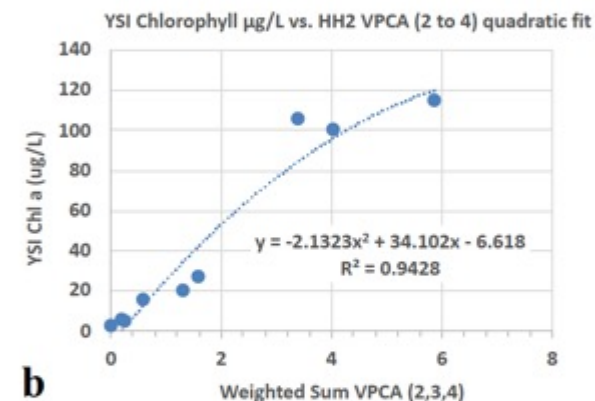

**Table 5.** Comparison to Kamerosky et al., Remote Sensing, vol. 7, 1441-1460, 2015 Calibration results

Statistic	Moses et al., (2009)	NDCI Quadratic Mishra & Mishra (2011)	This Study (Weighted S3A OLCI VPCA 2 to 4, Linear fit) Model 1	This Study (Weighted S3A OLCI VPCA 2 to 4, Quadratic fit) Model 2	This Study (Weighted S3A OLCI VPCA 1 to 4, Linear fit) Model 3
R	0.66	0.71	<b>0.96</b>	0.97	0.83

# Comparison of individual daily VPCA Results with average VPCA results.

- \* The extracted daily component loadings are stable, so the component scores and the regression coefficients of the average component loadings are stable.
- \* Averaging the component loadings gives even cleaner transfer functions to cell density and biovolume than the daily estimates:  $R^2$  increases to 0.96 and 0.94

# Summary and implications

- Method can provide a variety of products using NASA and ESA sensors: Phytoplankton classes, pigment degradation products, suspended minerals
- VNIR derivative spectroscopy unmixes and quantifies plant pigment assemblages in Optically complex aquatic systems (e.g. Lake Erie, Indian River Lagoon)
- Tracks phytoplankton contribution to eutrophication, with implications for harmful algal blooms, anoxia, and fisheries
- KSU VPCA decomposition method has been applied successfully to hyperspectral and multispectral lab samples, field-based spectroradiometers, HICO, NASA Glenn HSI2, MODIS A/T, Landsat 4-8, Sentinel-3A/B
- VPCA is in the process of being ported to GEE: Preliminary results are very promising
- VPCA is well suited for application to current and the upcoming hyperspectral SBG and PACE missions: Makes use of all information present in hyperspectral data
